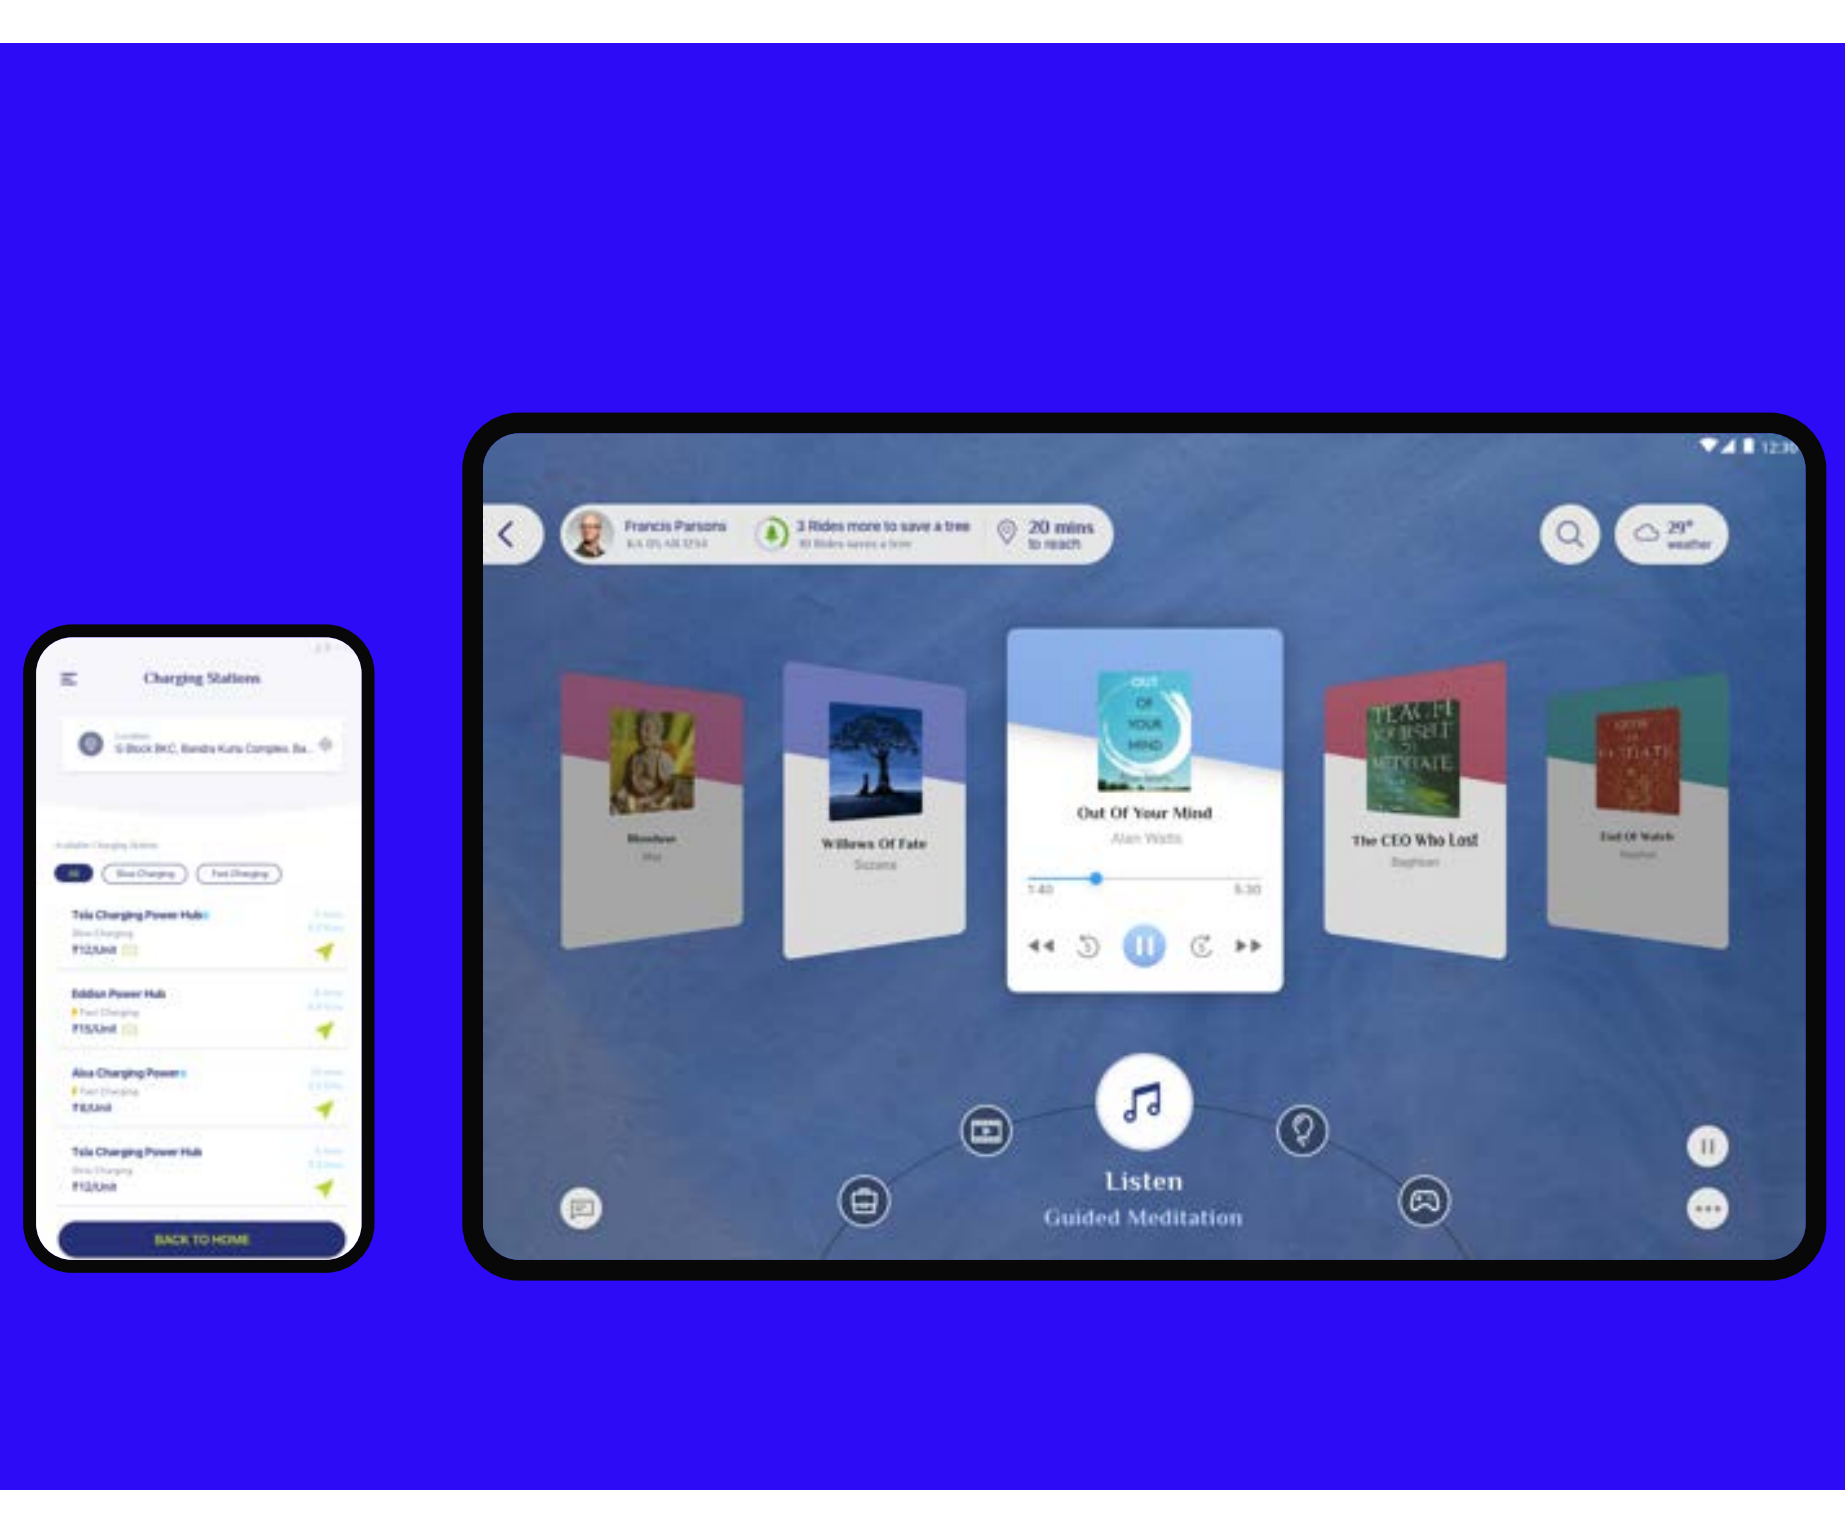
Mapping the eco friendly route for Mahindra

Industry
B2C



About the Project

Mahindra - Glyd is an electric cab service launched in India with a concern to save the environment from pollution. There was an application needed to build a bridge between the user & the business.

Mahindra - Glyds has the below three applications for their project:

01
Glyd Commuter Application

02
Glyd Driver Application

03
Glyd Experience Application

Challenges

To design a premium application targeting the high end corporates. The Experience Application is a challenge in balancing the visual asethetics, to deliver a rich premium experience.

Achievement

Our Design solution to Glyd has won the **“NASSCOM Design4India Award 2019"** in the Digital Ergonomic Product Category.

My Role

Glyd Experience Application - Tab

User Experience Design, User Interface Design & Interaction Design

Got an immense opportunity to work in the Glyd Experience Applications to visualise, define & craft the UX, UI & Interaction Designs. Its challenging to balance the entire asthetic feel of the application. This aplication is used in the Glyd cabs, where all the three passengers in the cab can experience this application while travelling where they can interact with this application to play music, podcasts & also to watch (Videos, News & TV shows).

Driver Charging Module - Glyd Driver Application

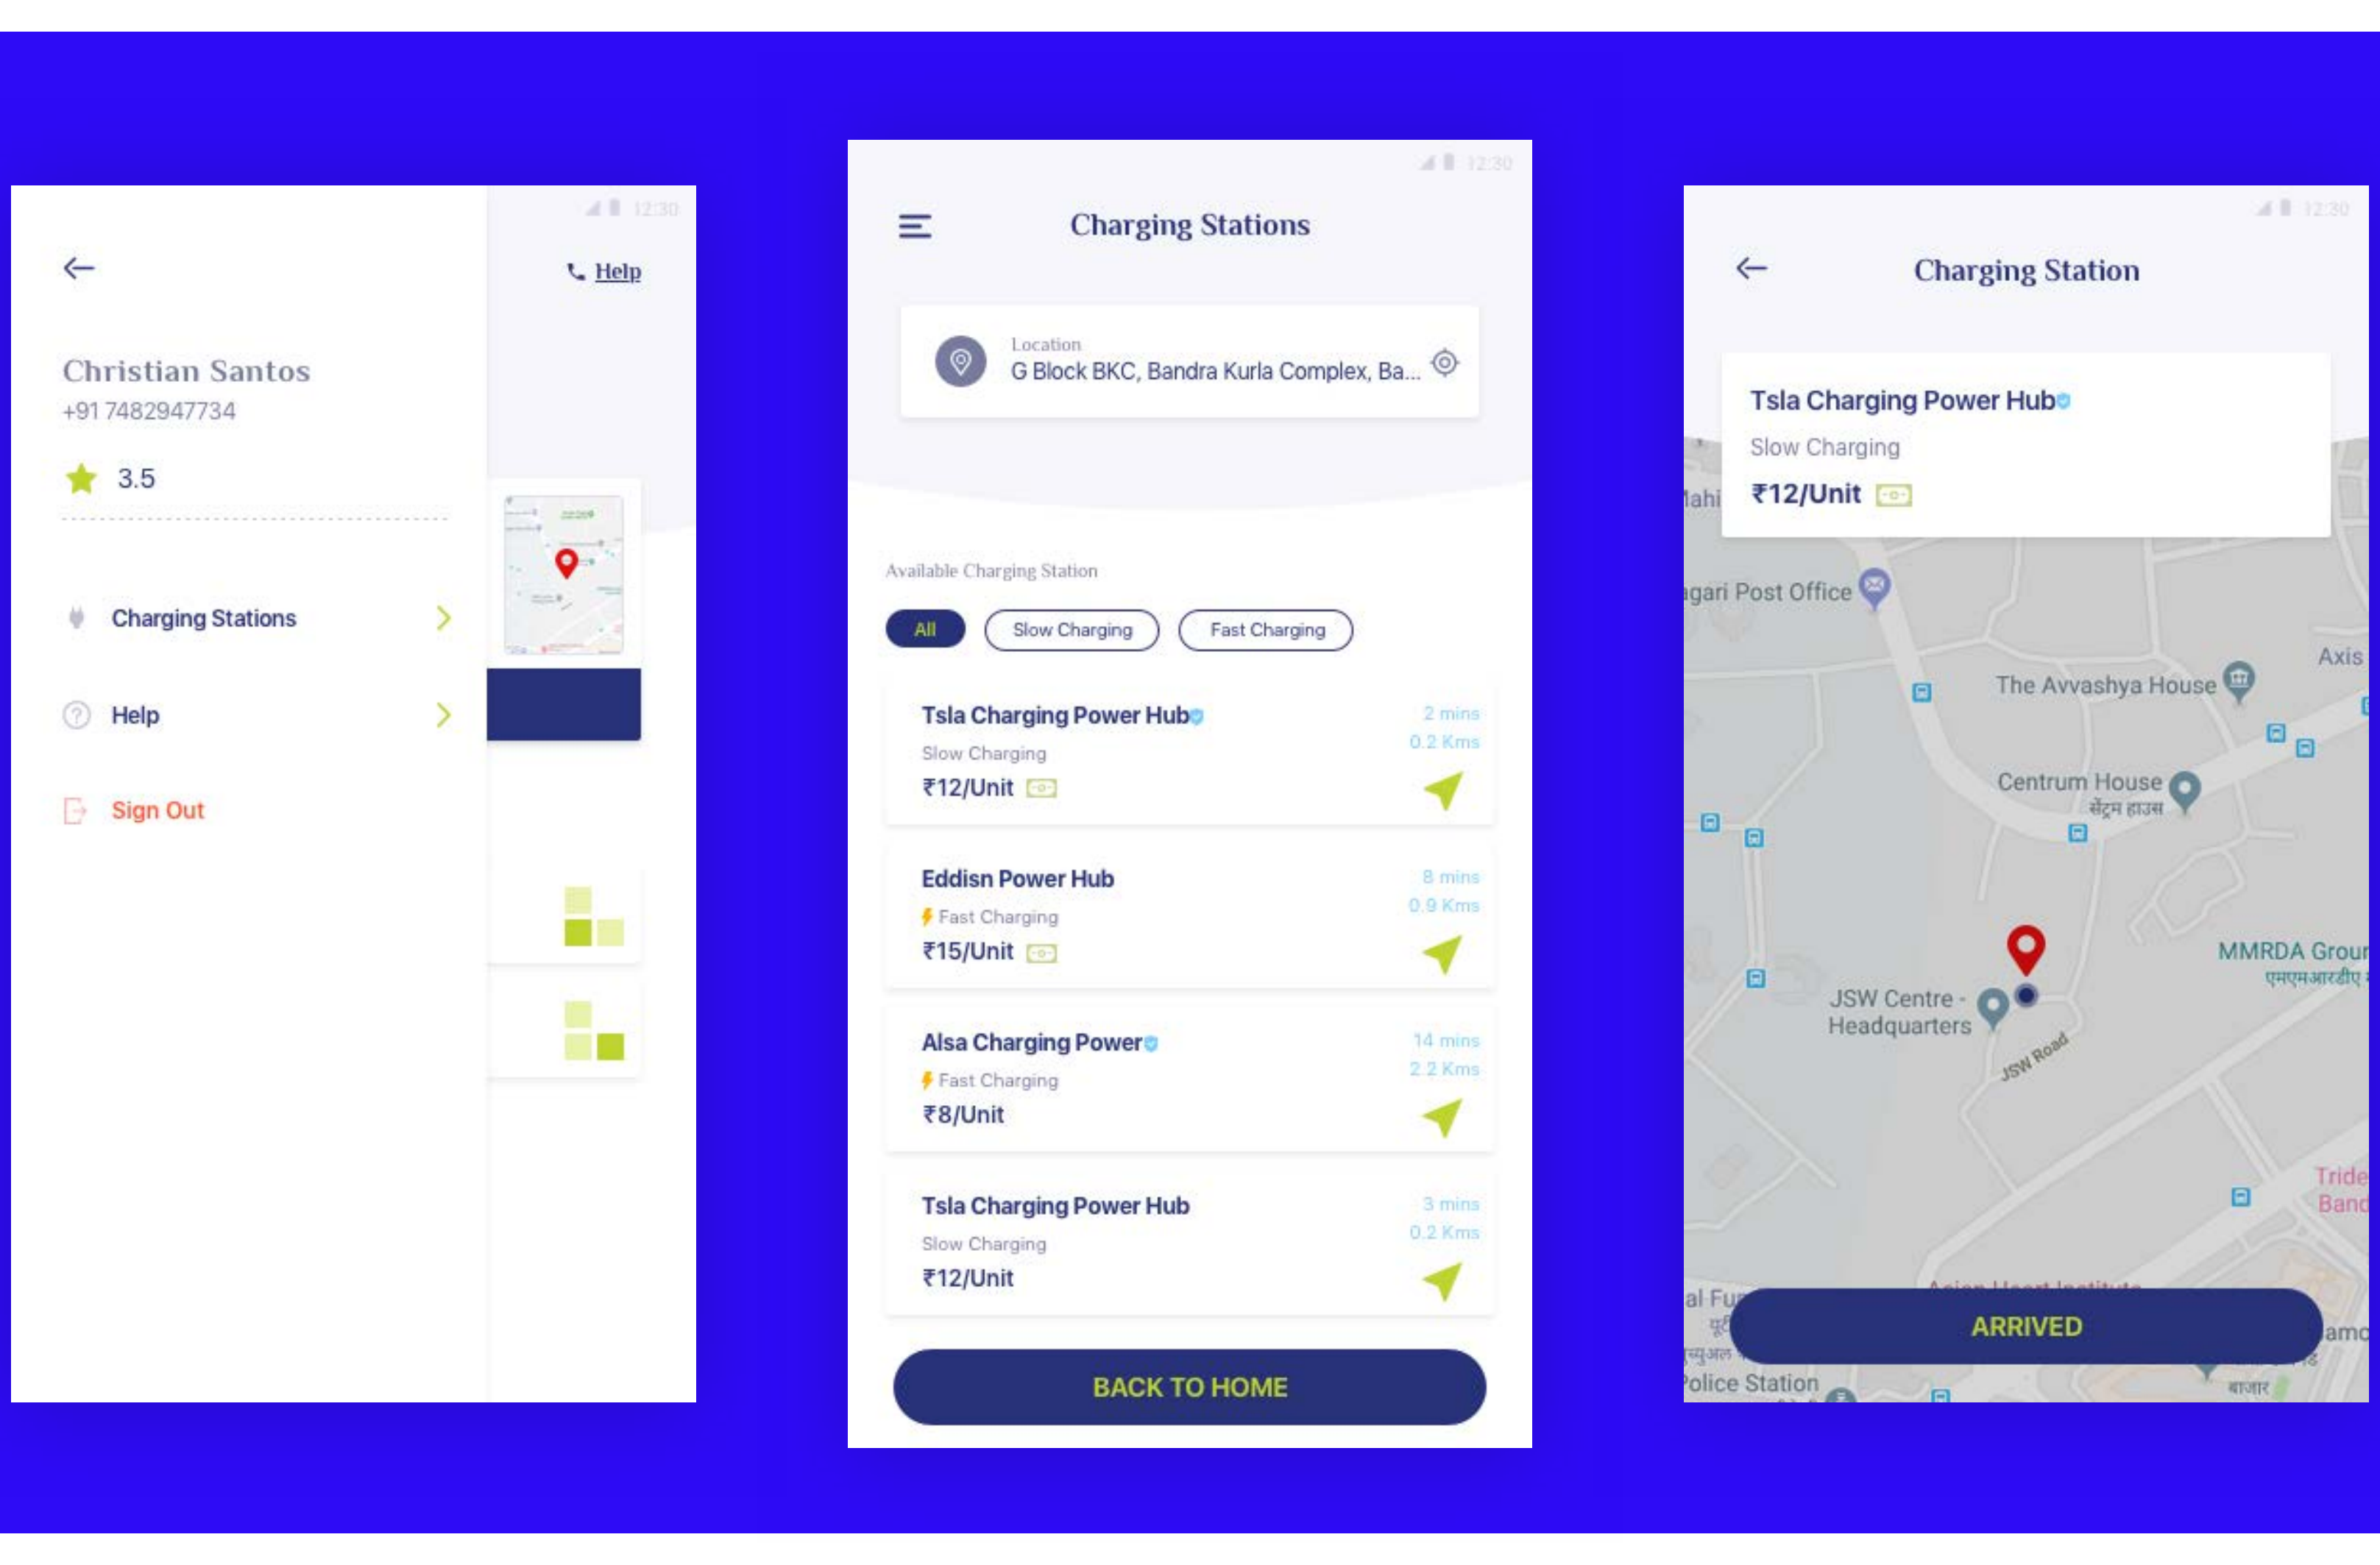
User Experience Design & User Interface Design

The charging module for the driver application is used by the drivers to find the charging station near by. Got an opportunity to work on the wireframes & the visual designs for this charging module also.

User Interface Design

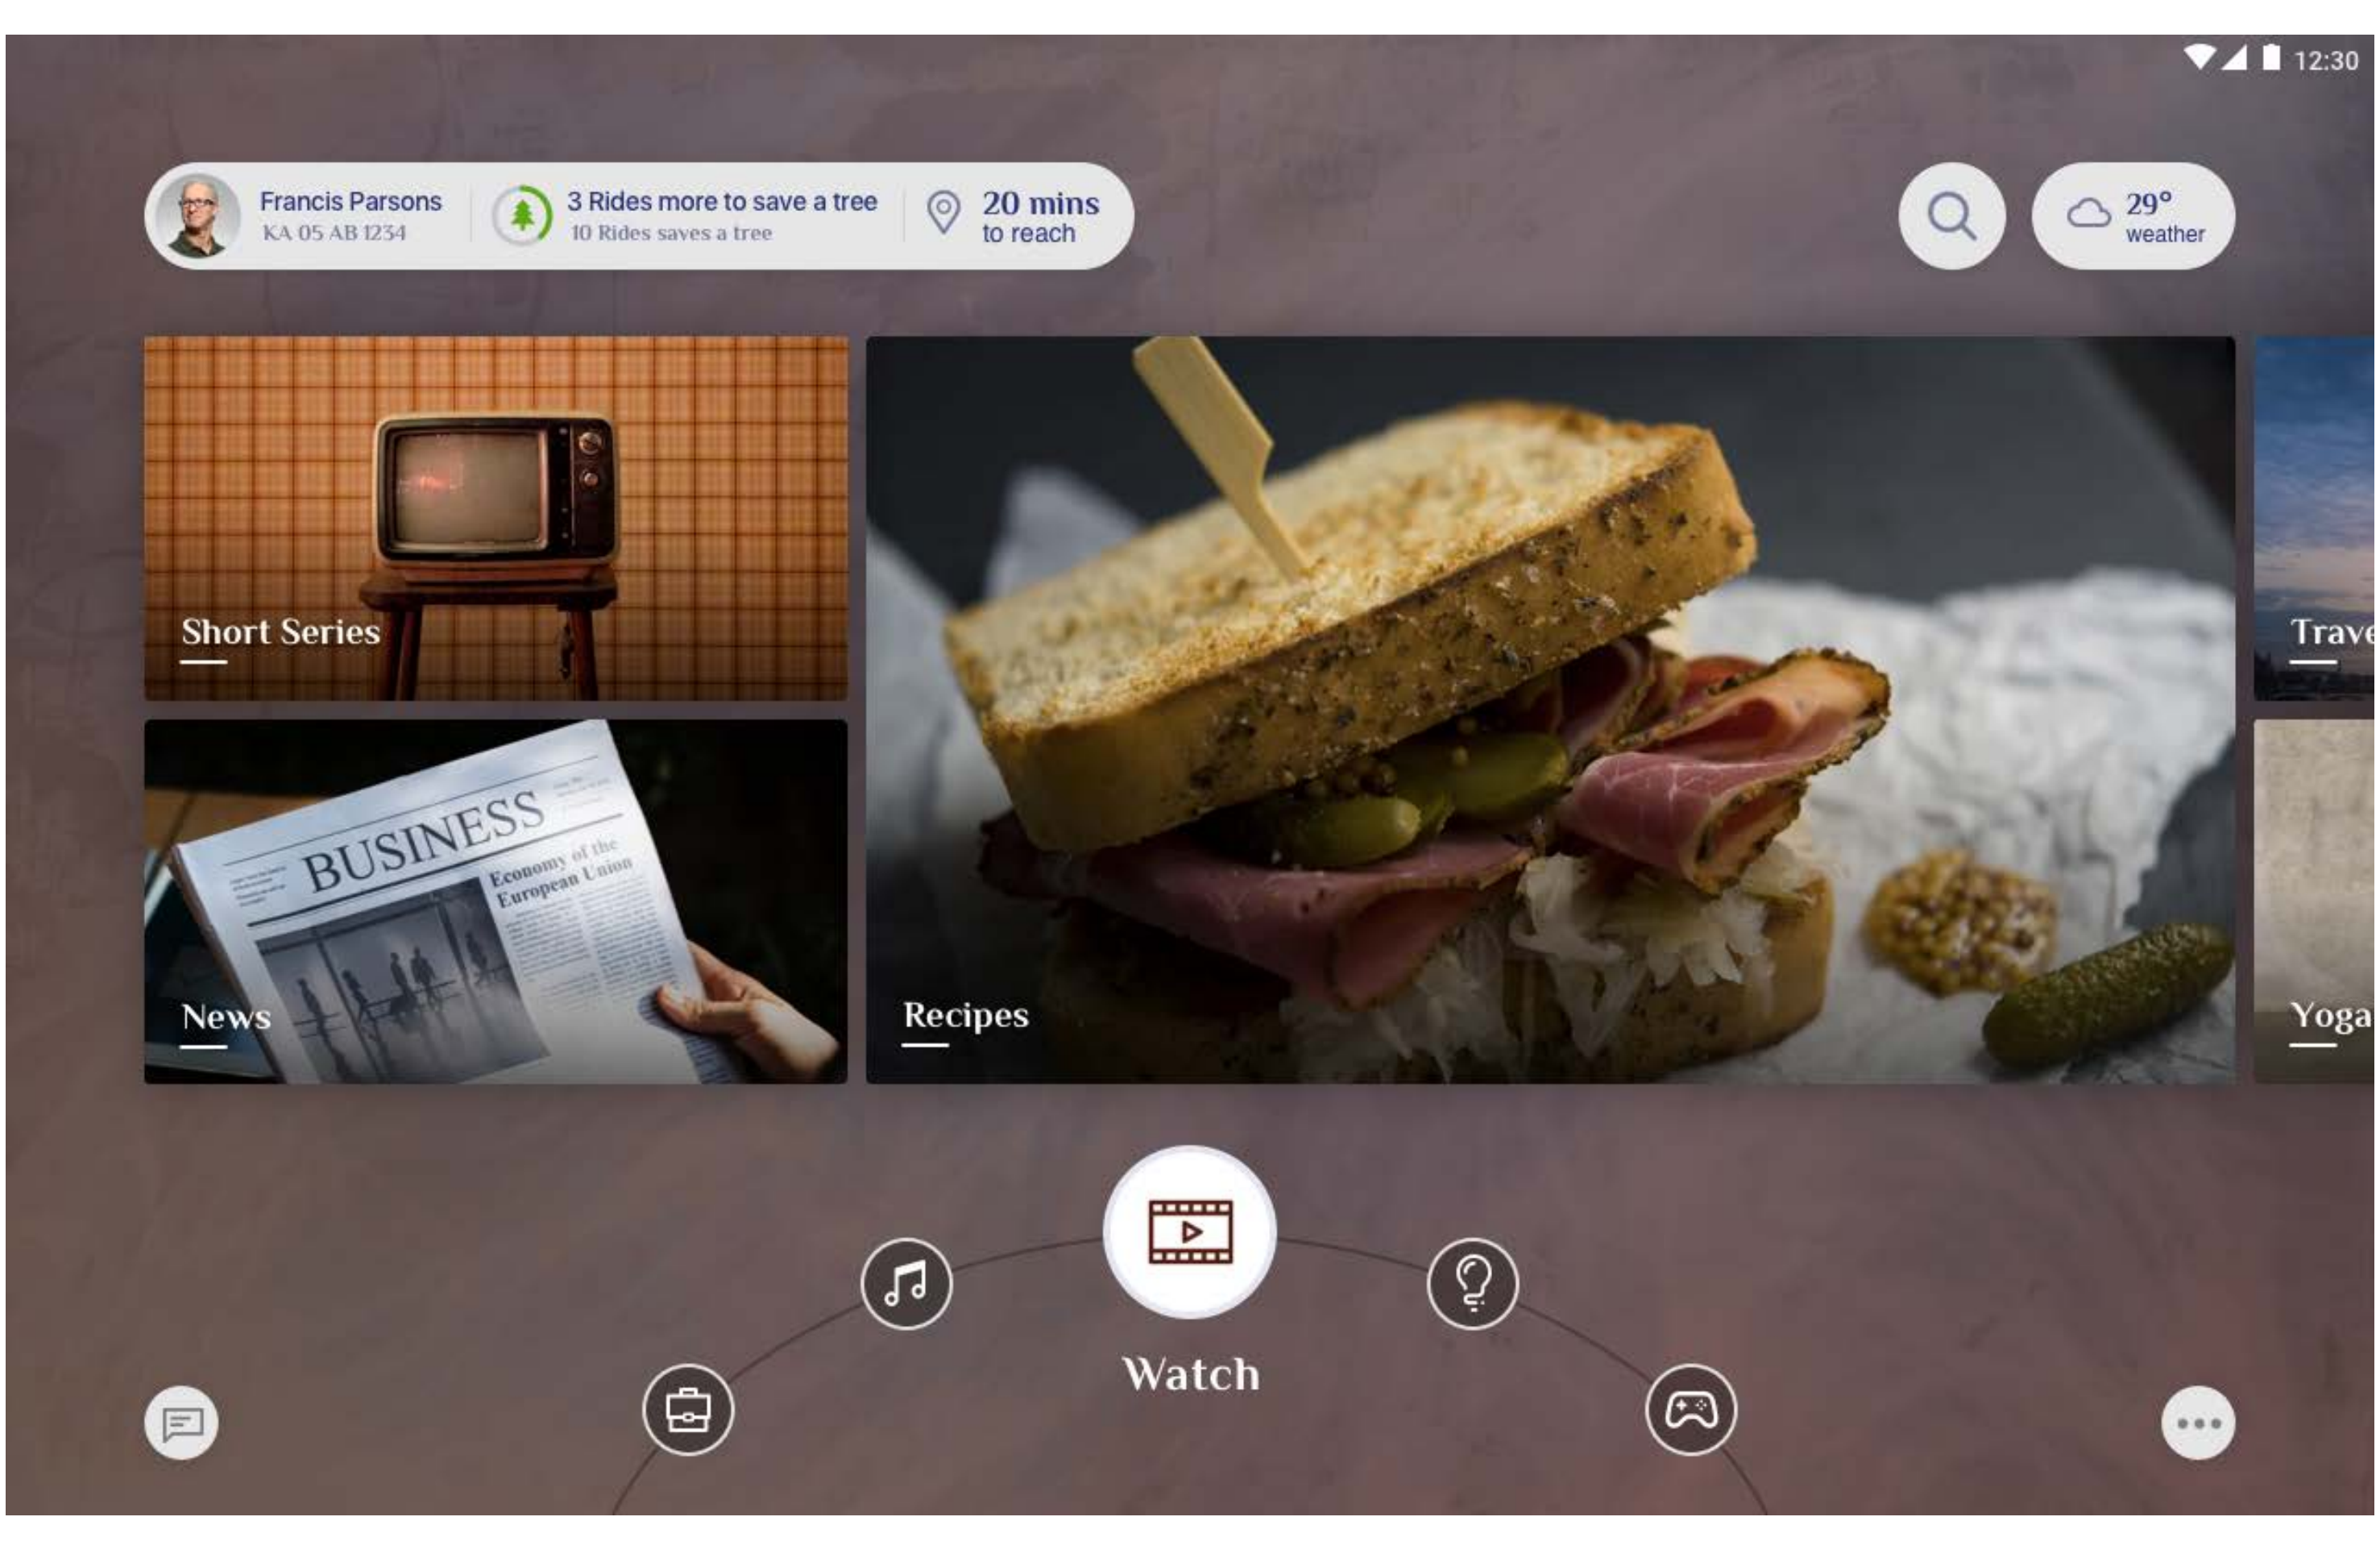
Driver Charging Module

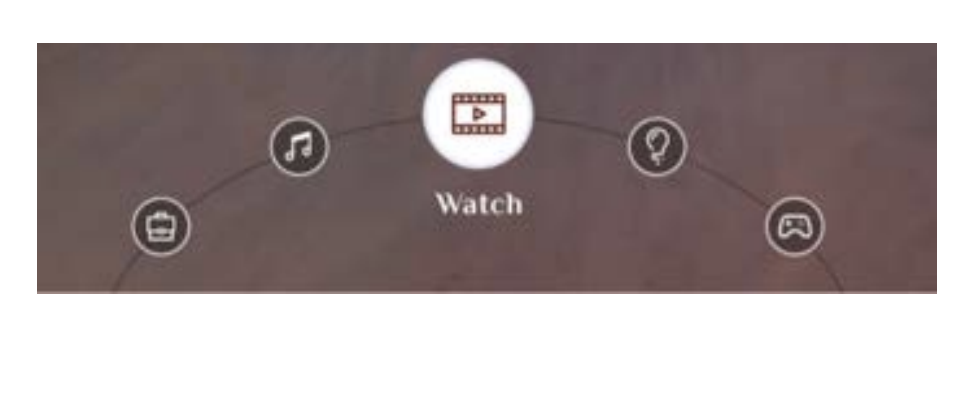
The driver charging module is an integral part of the Glyd - Drive Application, where the driver can use this module to check the nearest charging station & also he can book the time slot to charge the car.



Mahindra Experience Application

The Mahindra Experience Application is used in Glyds Electric car where the passenger can access this application in the tab & he can experience music, video & also he can have work related video calls using this application.





The primary navigations are done by using this component. This interaction pattern gives the user an engaging experience with the application.
